EDUCATION

06.2022-01.2023 **Bilge Adam Boost**

The 6-month (660 hours) Full Stack .NET Developer training I completed at Bilge Adam Academy provided me with a comprehensive experience that included theoretical lessons, practical application classes, and real-life projects. Thanks to this training, I have gained in-depth knowledge in designing and developing web applications and services using Microsoft .NET Framework and .NET Core.

The application classes equipped me with practical skills to tackle challenges that may arise in real-world scenarios. To reinforce these skills, I developed numerous projects independently throughout the training. These projects provided a unique opportunity to enrich my portfolio and solidify the skills I acquired.

My Full Stack .NET Developer training has equipped me with critical skills such as a customer-centric approach, project management, and teamwork. Now, I aim to utilize this experience and knowledge to build a successful career.

EXPERIENCES

06.2018-07.2018 **Yüksel Proje / Intern Field Engineer**
Kuzey Marmara Highway

06.2018-07.2018 **Yüksel Proje / Intern Technical Office Engineer**
Department of Transportation

06.2017-07.2017 **YP İnşaat / Intern Field Engineer**
Koordinat Çayyolu Project

PROJECTS

Human Resources Project

This project is a web application built using Asp.Net Core MVC and follows the Repository Design Pattern. It was developed by a team of three individuals and utilized Azure CloudDB as the database, with the project being managed through Azure DevOps.

The project encompasses various roles including an Admin responsible for creating the website, companies, company managers, and employees. The Admin has the ability to add companies to the website, and during the contract period, companies can access the human resources pages. Additionally, the Admin can assign managers to companies and these managers can perform actions such as adding or removing employees.

Users are directed to their respective pages upon logging into the website, utilizing the Identity library for authentication. This enables users to access their personalized content and perform relevant operations.

PROJECTS

Record Store Management Panel

This is a form application built using .NET Core with a Code-First approach, where the database is created based on the defined tables. The application manages stock information, as well as artist and album details. Users can perform various operations such as adding, deleting, and updating albums and artists.

The application provides a user-friendly interface for managing stock, artists, and albums. It allows users to input and modify information related to albums and artists, including details like album title, artist name, and stock quantities. Users have the ability to add new albums or artists to the database, delete existing ones, and update the information as needed.

Burger Restaurant Order Panel

This is a Windows Forms application built using .NET Framework and following the principles of Object-Oriented Programming (OOP). The application allows users to create orders and add or remove items from their orders.
